AQUASYSTEM PP-R

Strong Veins for Your Building

Who we are

Connections for Life

GF Piping Systems is the leading flow solutions provider across the world. We enable the safe and sustainable transport of fluids. Our business is driven by maintaining industry-leading sustainability levels, innovating through digitally enabled solutions, and investing in a culture built on caring, learning, and performance.

Your partner for modern plastic piping systems

The plastic piping systems from GF Piping Systems are non-corrosive and do not need replacing throughout the system's entire service life. Therefore, they contribute to the increased reliability of the system while lowering maintenance costs and staff requirements. They are excellently suited for applications involving potable and sewage water, coolants, acids, leaches, and other chemicals, as well as abrasive compounds.

GF Piping Systems, founded more than 200 years ago in Switzerland, supports its customers both in the initial switch from metal to plastic and in retrofits – across all project phases. They benefit from more than 60 years of experience in plastic systems and application knowledge from 100 countries. With Specialized Solutions, GF Piping Systems supports the design and installation of state-of-the-art plastic piping systems, so that owners and planners can concentrate on their daily business without interruption. GF Piping Systems is present every step of the way, from the design phase all the way through to installation and maintenance.

Strong regional footprint

GF Piping Systems has been present in the Southeast Asian market since 1994, when the first office in the region was registered in Singapore. Today, with seven offices in five countries, production facilities in Malaysia and Indonesia and numerous regional partners across Southeast Asia, GF Piping Systems is committed to the region and ensures competent customer support and technical on-site training.

GF Piping Systems Malaysia

We Bring You Clean Water

Supplying the world with clean water is one of the major challenges of the 21st century. GF Piping Systems rises to this challenge by providing high quality piping systems. We develop and produce pipes, fittings, valves, flow measurement devices and fusion machines. These application-oriented system solutions allow transporting water, gas and industrial liquids safely and reliably. Whether in industry, utilities or building technology - GF Piping Systems has the right solution for you.

Innovation and technology

GF Piping Systems, through focussed research, is continually developing new products and technologies, setting new global standards in quality and performance for our customers.

All from one source

GF Piping Systems covers the growing demand for complete solutions from a single source in a wide range of applications.

Quality management

All system components are stringently tested in accredited test laboratories. Management and production procedures are certified to ISO 9001 and ISO 14001 to guarantee form, fit, function and compliance in whatever application they may be used throughout the world.

Sales and service — worldwide

Our local sales companies and representatives in over 100 countries provide one stop" shopping, including planning support, training and product availability.

Facts and figures

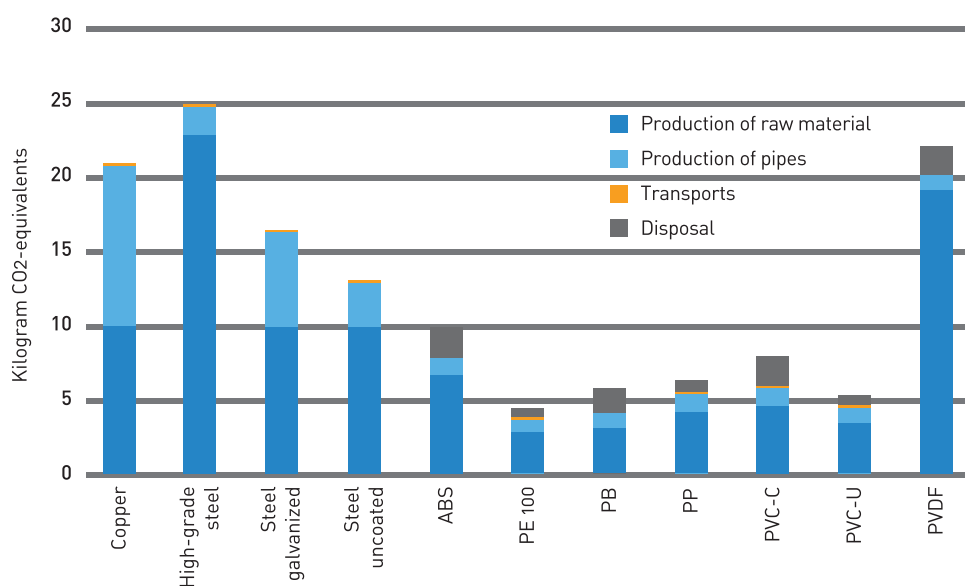

In 2021, GF Piping Systems with its 7'700 employees, 36 production sites and 31 sales companies achieved an annual turnover of 1.97 billion CHF respectively 2 billion USD. GF Piping Systems is part of the Georg Fischer Corporation.

Pioneering Towards a Green Solutions

In focus: Plastics and metal

Climate change, the finiteness of fossil fuels and a rapidly rising demand for energy are among the challenges we face in the future.

For companies it will become even more important to offer products and solutions which match these challenges. For example, piping systems made of plastic cause less carbon dioxide emissions than metal piping systems. We offer complete plastic systems for nearly every application, whether in building technology, water treatment, cooling or other segments. Our plastic piping systems are leak proof, corrosion-resistant, lightweight and long-lived.

The added value of our solutions: plastics are greener than metals

Plastic piping systems of Georg Fischer offered applications and dimensions almost ever have better results than competitive materials. In the case of PP-R the carbon dioxide emissions are roughly five times lower than those of a comparable steel pipe. This is the result of an study that focused on the ecological footprint of various piping materials.

Our devotion

The environment and nature form the foundation of our lives. For that reason, Georg Fischer considers the consumption of energy and resources as well as the production of air emissions to be major challenges for an industry devoted to people.

AQUASYSTEM PP-R

AQUASYSTEM is a comprehensive plastic piping system which complies with the requirements for hot and cold plumbing system. The wide product range provides the right solution for each application: pipes for hot water (PN 20 & PN 16) and cold water (PN 16 & PN 10) as well as socket fusion fittings and a wide selection of metal transition fittings.

As a full system "AQUASYSTEM" is totally corrosion free, reduce noise transmission through pipes and save energy due to low thermal conductivity. The outstanding properties of PP-R and superior GF product quality make AQUASYSTEM a practically maintenance free and extremely durable system. High quality plastic valves are also available.

Water services in buildings are complex, requiring both experience and careful material selection. The goal is to design and produce a piping system for hot and cold water supply that is easy to use and instal. All components are fully integrated and sturdy, whilst maintaining a competitive price.

GF is a leader producer of pipe fittings made of various materials since 1858. In the field of thermoplastic materials, GF is considered to be a pioneer, as well as one of the best known producers, utilising the most advanced technology in the world.

The test laboratory is one of the most established in the world in the field of plastic materials, and it is completely dedicated to research, development and testing of new products. The equipment and instruments used are the most modern and up-to-date in the market today, this makes it possible to carry out the most sophisticated tests.

This all comes together with the highest standard of technology, production and logistics, which contributes to guaranteeing the best product for the end users:

- quality
- experience
- reliability

AQUASYSTEM Added Value

- Longevity
Designed To Operate More Than 50 years
- Low Density At 0.91g/cm³
(1/9 of Metal Pipes)
- High Elasticity
 - » Resistance against impact and bending stresses
 - » Abrasion resistance
 - » Noise level reduced (water hammer)
- Chemical Resistance:
 - » Hygienically safe
 - » No corrosion
- Neutral Taste & Odour
 - » Suitable for food processing
- Low Thermal Conductivity:
 - » Thermal losses reduced
 - » Low formation of condensation
- Smooth Surfaces:
 - » Pressure losses reduced
 - » No incrustation
 - » Bacteriologically neutral
- Low Electrical Conductivity
 - » No electrolytic corrosion
- Fast & Easy installation
- Leak Proof with homogenous Joints

Benefits of Fusion Jointing:

- Homogeneous connection
 - » No cement / glue used
 - » Fitting and pipe become one unit = Homogeneous
 - » Joint with same characteristics of pipe material
 - » No solvent that could affect the water quality
- Easy and fast
 - » Socket Fusion jointing is done in seconds
 - » Only simple and inexpensive 230V tooling used
- Reliable and long lasting
 - » No more leaking joints
 - » Life time of 50 Years or more
 - » Jointing system tested according to EN ISO 15874 - 5 & 7
- No theft value

Covering Your Needs in Building Technologies

The right solutions for your potable water supply, heating and cooling applications - durable piping solutions developed to meet the highest standards of the modern building.

Potable water installations must comply with the highest hygiene standards. Hot water distribution requires an energy-efficient system including reliable measurement and control technology to ensure a high level of comfort. GF Piping Systems supplies long-lasting and efficient piping systems and valves for residential houses, hotels, hospitals, industrial buildings, recreational facilities, and ships.

Characteristics of The Material PP-R

Pipes and fittings are made of Polypropylene Random, also known as type 3. The quality of our material can guarantee a long life(50 years), high resistance to pressure and temperature. This material is suitable for hot and cold water and heating systems.

The special properties of the material, compared to the other materials, give the following advantages:

- high dimensional stability (when hot)
- maximum resilience

Properties	ISO	DIN	Unit	Values

Machines & Tools

Complete Socket Welder (Set)

- Available as a complete set in a practical metal case
- Heating bushes and spigots
- Timer
- Fusion marking template
- Floor stand
- Pipe shears

Model:

- Socket welder with electronic temperature control
- Instruction manual

d (mm)	Code	SP	Weight (kg)	Performance
20 - 32	300 206 539	1	7.10	230V / 800W
20 - 63	300 206 540	1	13.10	230V / 800W
75 - 110	300 206 541	1	14.20	230V / 1500W

Standard Socket Welder

- Floor stand
- Heating bushes and spigots
- Excluding heating bushes

Model:

- Socket welder with electronic temperature control
- Instruction manual

d (mm)	Code	SP	Weight (kg)	Performance
20 - 63	300 206 518	1	1.80	230V / 800W
20 - 110	300 206 519	1	3.55	230V / 1500W

SG 125

Socket fusion machine

- Portable heating element - socket fusion machine for use in the workshop and on job sites.
- For fusion jointing of PP and PE pipes and fittings
- **BASE MACHINE**
 - Compact, sturdy design, distortion-free machine bed
 - Handwheel with torque locking mechanism for the slide movement
 - Fast selection of insertion depth according to the pipe dimension
- **HEATER**
 - With electronic temperature control
 - High temperature accuracy over the entire heating surface
- **ADDITIONAL STANDARD EQUIPMENT**
 - Universal, left and right prismatic clamping devices, complete, for clamping pipe and fittings. Additional set of prismatic clamping devices for outer clamping of pipes available as an option.
 - V-shaped pipe support
 - Back stop
 - Machine specific tool set
 - Timer to clock fusion times
- Including transport packaging, without accessories

d-d (mm)	Performance	Code	Weight (kg)
16 - 125	230 V/1500 W	790 310 034	65.000
16 - 125	115 V/1500 W	790 310 036	65.000

TM 160 ECO Butt Fusion Machines

- Flexible and user-friendly heating element Butt Fusion machine for fusion joining PE, PP, PB and PVDF pipes and fittings on building sites and in trenches
- Scope of delivery includes: lightweight ECO hydraulic unit, flexible base machine, powerful planer, high performance heating element with electronic temperature control box, storage case for the planer and heater
- 115 V on request!
- Including transport packaging (carton pallet), without accessories and without reduction inserts

Type	d-d (mm)	Code	Weight (kg)	Performance
TM 160 ECO	40 - 160	790 150 010	86	230V/1900W

Heating Bushes

Model:

- Coated with Polytetrafluoroethylene (PTFE)
- Incrustation free
- ISO 15874, DIN 16962
- Corrosion free
- Low thermal conductivity

d (mm)	Code	SP	Weight (kg)
20	300 206 561	1m + 1f	0.120

Storage, Transportation and Handling of Plastics Pipes

Storage

- All storage areas should be flat and kept free from stones and sharp-edged objects.
- Single point contact support for any pipe is to be avoided.
- Pipes are to be stored in such a way to prevent any contamination of the insides.
- Storing pipes on their pallets will offer basic protection from damage.
- Storage zones and stack heights are to be chosen which avoid possible damage or permanent deformation.
- Stacks should be wedged to prevent movement.
- Pipes should be stacked in heights not exceeding 1 meter, pipe spacer must be used, ensure that there are no excessive loads on pipe sockets and full weight is supported by the frame of the pallet
- Wrapping film should be applied at all time and fastening bands secured against lateral movement should not be removed until shortly before installation.
- The location where pipe, fittings and other components are stored must provide as much protection as possible from UV exposure, dust, moist, excessive heat, corrosive or dangerous materials and other sources of contaminant. Pipes, fittings and other components should not be allowed to come into contact with soils, sands, fuels, solvents, oil, greases, paints (silicones) or heat sources during storage.
- Friction on pipes and fittings surface, or dragging pipes over the ground must be avoided at all times.
- Fittings packed in carton boxes should be sealed and stored in a dry area to protect against moisture.
- Significant impact or shock loads on thermoplastic pipe at low temperatures can fracture the pipe. Care should be taken to avoid dropping or striking the pipe with handling equipment, tools, or other objects.

Transportation & Handling

- Vehicles for transporting pipes should be selected in such a way so that the pipes can lay completely flat on the bed of the vehicle without any over-hang.
- All pipes are to be supported so that they cannot bend or become deformed.
- The area of the truck where the pipes are laid should be covered with either protective sheeting or clean cardboard (including all side supports) in order to prevent any possible damage from protruding rivets or nails etc.
- Pipes with higher pressure ratings or higher ring stiffness should be placed at the bottom of the load, ensure that there are no excessive loads on pipe sockets.
- Check that each individual bundle, package and pallet is securely tied, pipes should be secured and restrained during transport to ensure that no movement occurs.
- Care should be taken to avoid rough handling of plastic pipe. It should not be dropped or have other objects dropped upon it, nor should it be pushed or pulled over sharp projections. Surfaces friction must be avoided at all time.
- Pipes and fittings should always be loaded and unloaded with extreme care. Special support frames are to be employed when using equipment for loading or unloading from vehicles.
- Sudden shock impacts are to be avoided under all circumstances. This is especially important at ambient temperatures around or below 0° C under which circumstances the impact resistance of almost all materials is considerably reduced.
- Pipes and fittings are to be transported and stored in such a way so that they do not become contaminated by earth, mud, sand, stones, water, oils, chemicals, solvents, other liquids, animal excrement, the effects of weather and etc.
- We strongly recommend that all open pipe ends are covered by protective caps/wrapping film to prevent the ingress of foreign substances and matter inside the pipes.

Influence of Weather

- The influence of weather on all stored piping components is to be kept to an absolute minimum, i.e. such items should be kept in a covered and well ventilated warehouse. If pipes are stored in the open (for example, on construction sites) they must be covered with suitable coloured or plain black sheeting to protect them from the effects of weather (e.g. UV radiation) and/or effects of environment condition. Furthermore, a one-sided exposure to direct sunshine can ultimately lead to deformation and discoloration of the pipe.
- Pipes and fittings should be checked before use to ensure their perfect condition and complete compliance with national marking regulations.

Transport and Storage of Plastic Pipes

Wrong

Correct

Products that are not resistant to UV should not be stored outdoors and should be protected against sunlight.

Selection of Pipe Diameter

In order to select the best water flow depending on the available water pressure and corresponding usage, please refer to the table here below:

Table For The Selection Of Pipes Diameters And Water Flow

Water Connection Point	Flow (l/sec).	Pressure (bar)	Pipe Diameter (mm)
Wash Basin			
Tap DN 15	0.07	0.50	20
Mixer Tap DN 15	0.07	1.00	20

Assessment of Pressure

The pressure losses for distribution in the GF Piping Systems can be assessed by means of the following chart or by means of the following formula:

$$\Delta p = \lambda \cdot \frac{L \cdot \rho \cdot v^2}{d_i \cdot 2 \cdot 10}$$

$$\Delta p = \lambda \cdot \frac{L \cdot \rho \cdot v^2}{d_i \cdot 2 \cdot 10}$$

Where:

- Δp pressure loss in a straight pipe (bar)
- λ A pipe friction factor (in most cases 0.02 is sufficient)
- L length of straight pipe (m)
- ρ density of transported media (kg/m³)
- v flow velocity (m/s)
- d_i inside diameter of pipe (mm)

Loss Pressure Diagram for PN20 / PN28 Pipe

Example:

Pipe: 40 X 6.7 mm
Flow = 0.2 l/s
Water velocity = 0.4 m/s

From the diagram,
Pressure loss
= 70 Pa/m
= 0.7 mbar
(10,000 Pa = 0.1 bar = 100 mbar)

Assessment of Pressure

Loss Pressure Diagram for PN10 / PN14 Pipe

Assessment of Pressure

Pressure Losses in GF Fittings

Description	Symbol	Coefficient of resistance
Equal coupling		0.25
Elbow 90°		2.00
Elbow 45°		0.60
Equal tee 90°		1.80
Reduced tee 90°		3.60
Equal tee 90°		1.30
Reduce tee 90°		2.60
Equal tee 90°		4.20
Reduced tee 90°		9.00
Equal tee 90°		2.20
Reduce tee 90°		5.00
Threaded tee 90°, male		0.80
Concentric reductions up to 2 size		0.55
Concentric reductions up to 3 size		0.85
Threaded fitting, male		0.40
Threaded fitting, male, reduced		0.85
Threaded elbow, male		2.20
Threaded elbow, male, reduced		3.50

Example

Assume we have a water services system with the following characteristics:

- pipe diameter 25 mm
- total pipe length 10 m
- fittings used:
 - 4 coupling
 - 3 elbows 90°
 - 2 equal tees
 - 1 threaded coupling, male
- velocity 1.5 m/s
- flow rate 0.35 l/s
- T = 20°C

From the table,
 ξ_1 (coupling) = 0.25×4
 ξ_2 (elbow 90°) = 2.00×3
 ξ_3 (equal tees) = 1.80×2
 ξ_4 (threaded coupling, male) = 0.40×1

Total $\xi = 11$

$$\text{Total } P = \Delta p + H$$

From graph above,
 $\Delta p = 1100 \text{ Pa/m}$
 $= 11 \text{ mbar}$

For 10m length pipe,
 $\Delta p = 11 \times 10$
 $= \underline{110 \text{ mbar}}$

$$\begin{aligned} \text{Total } P &= H + \Delta p \\ &= 110 + 126 \\ &= \underline{236 \text{ mbar}} \end{aligned}$$

$$H = 10 \cdot \frac{\xi \cdot v^2 \cdot \rho}{2g}$$

where:
 H = pressure losses in fittings
 v = water velocity (m/s)
 g = specific gravating of water (kg/m^3)
 $= 9.8 \text{ m/s}^2$
 ξ = coefficient of resistance

$$\begin{aligned} H &= \frac{10 \times 11 \times 1.5^2 \times 1000}{2 \times 9.8} \\ &= 12630 \text{ Pa} \\ &= \underline{126 \text{ mbar}} \end{aligned}$$

Regression Curve

The regression curves affect pipe life depending on the fluid pressure, temperature and outer stress (see chart).

Regression curves

Regression curves according to **ISO 15874 & MS 2286**

◆ Actual data of PP-R measured with S2.5 pipes

Hydrostatic stress

Expressed in megapascals, induced in the wall of pipe when a pressure is applied using water as a medium. Using Hydrostatic stress and dimensions, the maximum working pressure can be calculated with the following equation:

The formula joining these parameters is : $R = P \times \frac{d-s}{2s}$

P = maximum inner pressure
d = outer diameter
s = thickness
R = outer stress

Example

T = 60°C Continuous operating life: 50 years
From the regression curve the result is: R = 4,9 Mpa
Calculation (from the formula)
P = 19,7 bar
Or P = 13 bar
(using safety coefficient of 1.5)

Permissible Operating Pressure

Water Temperature	Working years	Type of pipe		
		SDR 11	SDR 7.4	SDR 6
		S 5	S 3.2	S 2.5
		Pressure bar

DIN 8077 edition 07/1999 - coefficient factor 1.5

Thermal Expansion & Contraction

Thermoplastics are subject to greater thermal expansion and contraction than metals.

Pipes installed above ground, against walls or in ducts, especially those exposed to temperature variations, require changes in length to be absorbed in order to prevent strain on the pipes. Length changes can be absorbed by:

- a) Flexible sections
- b) Compensators

Flexible sections are the most common solution, being the simplest and the most economical. Calculation of the positioning of flexible section are therefore described in detail.

Calculation of change in length

During the design and installation of plastic pipes, it is very important to calculate the expansion caused by the possible difference between operating temperature and installation temperature.

The change in length is calculated with the following formula:

$$\Delta L = L \times \Delta T \times \alpha$$

Where:

ΔL = change in length (mm)

L = initial pipe length (m)

ΔT = temperature difference (°C)

α = expansion coefficient (mm/m°C)

The Expansion Coefficient

α indicates the elongation of a 1m pipe under a temperature increase of 1°C

Medium thermal expansion coefficient for PP-R pipelines :

$$\alpha = 0.15 \text{ mm/m}^\circ\text{C}$$

Example

Changes in length for PP-R pipe:

$L = 5 \text{ m}$

$\Delta T = 50^\circ\text{C}$

$\alpha = 0.15 \text{ mm/m}^\circ\text{C}$

$$\begin{aligned} L &= 5 \times 50 \times 0.15 \\ &= 37.5 \text{ mm} \end{aligned}$$

Position of The Flexible Arms

The low modules of elasticity of thermoplastics allows changes in length to be absorbed by special pipe sections where pipe supports are positioned so that they can take advantage of the natural flexibility of the material.

The length of such sections is determined by the diameter of the pipeline and the extent of the thermal expansion to be compensated.

In order to simplify design and installation, the temperature of the pipe wall, a third factor, will not be taken into account, especially since most pipes are installed in an environment with ambient temperature in the range of 5 to 30°C.

Arrangement of fixed point support clamps (PF)

Fixed points direct thermal expansion of the pipe in the desired direction. Fixed points should always be installed at the fitting and should support it on both sides or be installed in between two fittings.

Sliding support clamps (PS)

Sliding fasteners allow an axial movement of the pipe. The clamp must be in line with the pipe. Sliding clamps must be lined with rubber inserts suitable for plastic pipe movement to avoid pipe damage.

PS : sliding point PF: fixed point
PF : fixed point
LBF : flexible arm length

Example for the assessment of the flexible arm

Data: $L = 10 \text{ m}$
 $d = 50 \text{ mm}$
 $T_{\text{installation}} = 15 \text{ }^{\circ}\text{C}$
 $T_{\text{max operation}} = 80 \text{ }^{\circ}\text{C}$
 $\Delta L = 0,15 \cdot 10 \cdot 65 = 97,5 \text{ mm}$

Position of The Flexible Arms

Assessment of the flexible arm for PP-R pipe

$$L_{BF} = C \times \sqrt{\Delta L \times d_e}$$

L_{BF} = flexible arms length
 C = constant PP-R = 20
 ΔL = change in length (mm)
 d_e = outer pipe diameter

Example

What is the flexible arms length if the expansion ΔL is 37 mm on a d63 pipe?

$$L_{BF} = 20 \times \sqrt{37 \times 63} = 966\text{mm}$$

Insulation & Thermal Conductivity

AQUASYSTEM PP-R for Polypropylene - Random (PP-R) pipes and fittings are designed to have low thermal conductivity. Generally it would not be required to install thermal insulations for concealed or exposed pipes and fittings within an enclosed environment. However insulation may be needed, depending on the countries regulations, warm or cold application or that of energy-saving requirement. Insulation guidelines, as per DIN 1988, depends on the respective installation; the use of hot or cold water and the wall thickness.

Thermal conductivity

There is a time-dependent transfer of heat (Q) between two points of a body which have different temperatures. Considering a wall of cross-sectional area A and thickness e, the heat conducted from one side to the other is directly proportional to the (maintained) temperature difference between the sides, to the area A and to the time t, It is inversely proportional to the thickness e:

$$Q = \lambda \cdot A \cdot t \cdot \Delta T / e$$

The constant of proportionality k depends on the wall's material and is called its coefficient of thermal conductivity.

$$[\lambda] = W / (m \cdot K) = Wm^{-1} K^{-1}$$

W = watt, m = meter, K = Kelvin (= °C)

Substance	Coefficient of thermal conductivity (Wm ⁻¹ K ⁻¹)
Foam Plastics	0.02 - 0.05
PVC-U	0.16
PVC-C	0.17
PP	0.22
PE-HD	0.41
Copper	400
Water	0.61
Air	0.023

Cold Water

Type of Installation	Guidelines value for minimum thickness of insulation for cold water system A= 0.040 w/mK
Exposed installed Pipe in a unheated room (e.g cellar)	4 mm
Exposed installed Pipe in a heated room	9 mm
Pipes installed in a channel without additional heated pipelines	4 mm
Pipes installed in a channel besides additional heated pipelines	13 mm
Pipes installed in building slit / Raising main	4 mm
Pipes installed in wall recess next to heated pipelines	13 mm
Pipes laid on cement floor	4 mm

The insulation thickness, applied to a diameter of d = 20mm, for other coefficients of thermal conductivity have to be calculated correspondingly. (DIN 1988 PART 2)

Thermal Conductivity for Hot Water

Based on 60°C water temperature and environment temperature of 30°C per meter (unit in J/s)

Dimension		20	25	32	40	50	63	75	90	110	125	160
Material	PP-R S2.5	99.84	101.31	100.75	101.69	102.82	108.62	102.31	102.31	102.54		
	PP-R S3.2	126.29	126.29	129.00	129.00	128.45	130.11	129.19	129.93	129.26	129.73	129.70

- Calculation is not considered the friction factor, head loss and any other factor that could effect on the fluid temperature. Calculation is based on steady state condition
- Theoretical value may differ from the actual condition

Installation Recommendations

Direct embedding of PP-R pipes

PP-R pipes can be embedded directly in concrete. The pipes can withstand the additional axial strains, which occur due to impeded expansion. In such cases, the stress present in the pipe and fittings must be calculated to prevent too high internal stress. It is important to prevent any exposed pipes when the pipe is covered with mortar.

Indirect embedding of PP-R pipes

Where pipework is installed under plaster or embedded into concrete, the flexible sections at bends and branches must be padded for the calculated distance a , as also the branches and elbows in the affected section

Installing compensators

The low modulus of elasticity means that the reaction force of plastic pipes to thermal changes is low compared to metal pipes. This makes normal compensators designed for use with metal pipes unsuitable because of their high inherent resistance. Only freely moving compensators may be considered: rubber compensators, PTFE-corrugated compensators or suitable selected metal multi-disc compensators.

Pipes brackets

Plastic pipes need regularly space support (see blow table), the bracket distance depends on many factors such as temperature, pressure, diameter and material. In every case, the inner diameter of the support must be greater than the external diameter of the pipe, so as to permit pipe movement due to pipe expansion.

PP-R PN28/PN22/PN14 Bracket Spacing

distance between two brackets in cm

d (mm)	PN10 / PN14	PN16 / PN22		PN20 / PN28	
	20°C	30°C	40°C	50°C	60°C

Socket Fusion Installation

1

Fix heating bushes

Attach the heating bushes on the heating tool. A maximum of two sets of bushes can be attached at the same time.

2

Clean the heating tools

Wipe the heater bush with a clean cloth. This process must be repeated after each welding.

3

Check the temperature

Once the socket fusion machine is turned on, set the temperature on the electronic display which must range between 255°C and 265°C. To ensure correct temperature, regular calibration is recommended.

4

Cut the pipe

Cut the pipe at right angle; if necessary, remove burrs from inside and cut deformed or damaged pipe ends of 5 cm.

5

Clean pipe and fitting

Clean the fitting of the sockets on the inside and the outer wall of the pipe (the presence of dust, grease or other impurities can affect the fusion quality and lead to weak jointing).

6

Mark the pipe

Mark the insertion depth on the pipe (see table). The mark must remain visible under heating and jointing.

7

Heat pipe and fitting

Push the pipe and the fitting straight into the heating bushes. Pull out the pipe and fitting slowly and without twisting once the heating time has elapsed.

8

Joint pipe and fitting

Push the pipe into the fitting so that the welding beads of pipe and fitting touch together. During the jointing time, small adjustments in angle and alignment can be made. During the cooling time, any stress on the joint must be avoided.

9

Fusion inspection

The outer fusion bead must be inspected. A double bead must be uninterrupted all around the pipe circumference.

Summary value table

Pipe Diameter (mm)	Insertion depth (mm)	Heating time (sec.)	Jointing time (sec.)	Cooling fixed (sec.)	Cooling time (min.)
20	14	6 (5 sec. for PN10)	4	6	2
25	16	7	4	6	3
32	18	8	6	10	4
40	20	12	6	10	4
50	23	18	6	20	5
63	26	25	8	20	6
75	28	30	8	30	8
90	31	40	10	30	8
110	33	50	10	40	8
125	40	60	10	50	8

Butt Fusion Installation

Butt Fusion Jointing of PP Piping Systems

Butt fusion jointing method

The fusion areas of the pipes and fittings are heated to fusion temperature and joined by means of mechanical pressure, without using additional tools. A homogeneous joint results. Butt fusion must only be carried out with fusion jointing machines which allow the jointing pressure to be regulated. Details of the requirements for machines and equipment used for butt fusion jointing thermoplastics are contained in DVS 2208 Part 1. The drawing to the left illustrates the principle of fusion jointing.

General requirements

The basic rule is that only similar materials can be fusion jointed. For best results, only components which have a melt flow index in the range from MFR 190/5 0.4 to 1.0 g/10 min should be fusion jointed. This requirement is met by PP butt fusion fittings from GF.

The components to be jointed must have the same wall thicknesses at the fusion area. Butt fusion jointing may only be performed by adequately trained personnel.

Check the temperature

Recommended temperature of heating element between 200°C to 220°C. Check temperature before commencing the fusion jointing, this is best carried out with the use of a digital thermometer with a sensor for measuring surface temperature.

To ensure the right temperature setting should be checked from time to time during the jointing work. The temperature of the heating element is particularly sensitive to ambient temperature and drafts.

The principle of fusion jointing

Join only components with similar wall thicknesses

Butt Fusion Installation

Fusion jointing procedure

Once it has attained the fusion temperature, position the heating element in the fusion jointing machine. Press the surfaces to be jointed against the heating element with the force required for equalisation until the entire circumference of each of the jointing faces rests completely against it and a bead (see the table) has formed. Reduce the equalisation pressure almost to 0 ($p \approx 0.01 \text{ N/mm}^2$). The heating time listed in the table is measured from this moment.

Once the heating period has elapsed, remove the parts from the heating element which should then be removed without touching the jointing surfaces and push the heated surfaces together immediately. The changeover time must not exceed the value listed in the table. Pay particular attention during jointing that the parts be moved together swiftly until the surfaces are about to touch. Then they should be moved together so that they are in contact along the entire circumference. Next the pressure should be increased rapidly to the present jointing pressure within the period of time specified in the table. This pressure must be maintained during the entire cooling period. Adjustment may be necessary, especially shortly after the jointing pressure has been attained.

The jointed parts must stay in the fusion jointing machine under jointing pressure until the end of the cooling period specified in the table.

Carrying out the pressure test

All fusion joints must be allowed to naturally cooled completely before pressure testing, i.e. as a rule wait about 1 hour after the last joint has been completed.

Join and cool

Leave parts in the fusion jointing machine at fusion pressure until the end of the cooling period!

Fusion check

A bead should form around the entire circumference of the pipe. K in the diagram to the left should always be positive.

Approximate values for Butt Fusion of PP₁

Wall thickness (mm)	Equalisation at $p=0.10 \text{ N/mm}^2$ Height of bead (mm)	Heating time ²⁾ $p=0.01 \text{ N/mm}^2$ (sec)	Changeover time max. (sec)	Time to reach full jointing (sec)	Cooling time ²⁾ under jointing $p=0.10 \text{ N/mm}^2$ (min)
up to 4.5	0.5	up to 135	5	6	6
4.5 - 7	0.5	135 - 175	5 - 6	6 - 7	6 - 12
7 - 12	1.0	175 - 245	6 - 7	7 - 11	12 - 20
